Bulletin No. 23 September 21, 2015

Palivizumab Prophylaxis — Alaska, 2015–16 RSV Season

Background

Respiratory syncytial virus (RSV) is an important cause of hospitalization for infants in the United States.¹ Hospitalization rates are higher for certain risk groups, such as premature infants—particularly those <29 weeks gestation—and infants with chronic lung disease or congenital heart disease.¹ Rural Alaska Native children have historically had 5-fold higher RSV hospitalization rates compared to other U.S. children.²

Palivizumab (Synagis®) is a monoclonal antibody that reduces the risk of RSV hospitalization in certain high-risk children.^{1,3} In 2014, the American Academy of Pediatrics (AAP) revised eligibility criteria for palivizumab prophylaxis to restrict recommendations to children at highest risk: 1) premature infants aged <12 months who are born before 29 weeks gestation, 2) infants aged ≤12 months with hemodynamically significant heart disease, 3) infants aged <12 months with anatomic or neuromuscular conditions that impair the ability to clear airway secretions, 4) children with ongoing chronic lung disease of prematurity aged <2 years who require supplemental oxygen for at least the first 28 days after birth, and 5) children aged <2 years who are profoundly immunocompromised.¹ Throughout most of the U.S., palivizumab prophylaxis for high-risk children starts in November and involves up to five monthly doses.^{1,3}

Alaska RSV Seasonality

The RSV season is generally defined as the first and last 2 consecutive weeks during which RSV was laboratory-confirmed in ≥2 specimens and >10% of submitted specimens.⁴ RSV testing at the Alaska State Virology Laboratory (ASVL) is conducted using the GenMark eSensor Respiratory Viral Panel (RVP, a multiplex PCR platform) on all submitted respiratory specimens. The RSV season can vary by year. For example, during the 2013–14 season, ASVL consistently detected RSV in the weeks ending January 5 through June 21, about 1 month later than during the five prior seasons. By contrast, during the 2014–15 season, ASVL consistently detected RSV in the weeks ending November 8 through May 9 (Figure 1). Seasonality also varies by region and facility (Figure 2). On August 5, 2015 a workgroup of providers and public health officials concluded that palivizumab administration during November 30 through May 15 continues to provide the best coverage for RSV prevention in Alaska.

Alaska Medicaid Palivizumab Reimbursement Criteria

During the 2014–15 season, Alaska Medicaid reimbursed up to five monthly palivizumab doses from November 30 through May 15. For the 2015–16 season, the Medicaid reimbursement period and eligibility criteria for palivizumab will remain the same as 2014–15, and will continue to reflect the 2009 AAP criteria (Table).^{4,5} If the 2015–16 RSV season starts prior to

November 30, Medicaid will adjust the coverage dates accordingly (Table).⁵

Figure 2. RSV-Positive Tests by Week from Three Alaska Hospitals — Alaska, 7/1/14 through 6/30/15

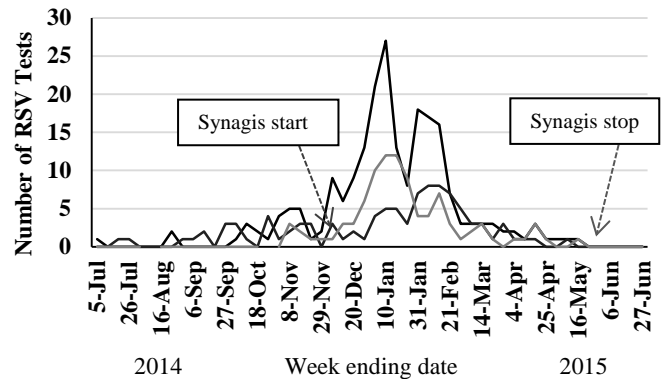

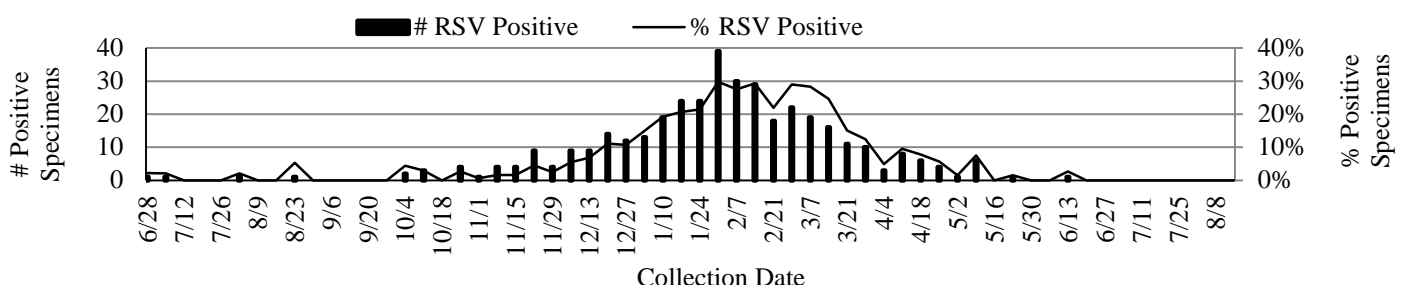

Table. Alaska Medicaid Palivizumab Coverage for the 2015–16 RSV Season⁵

Date of Birth	Gest. Age (Weeks)	Risk Factors	# of Doses
Born Sep 3 or after, 2015 (<3 months)	32 to <35	At least one: • daycare attendance • sibling aged <5 years • home without running water • ≥3 people in child's bedroom or ≥7 in child's household	≤3, until 90 days of age
Born after May 30, 2015 (<6 months)	29 to <32		≤5
Born after Nov 30, 2014 (<12 months)	<29		≤5
Born after Nov 30, 2014 (<12 months)	Any	• congenital airway anomaly • neuromuscular disease	≤5
Born Nov 30 2013 or after, with CHD; or born after Nov 30, 2013 with CLD	Any	• congenital heart disease (CHD) • chronic lung disease (CLD)	≤5
